                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-08-428-927-5

US-08-428-927-5

US-08-428-927-5

Sequence 5, Application US/08428927

Patent No. 5756456

CENTERAL INFORMATION:
APPLICANT: Ho, Wei-Hsien
TILLE OF INVENTION: SENSORY AND MOTOR NEURON DERIVED FACTOR (SMDF)

NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSES: Genentech, Inc.
STREET: 460 Point San Bruno Blvd
CITY: South San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 1; Length 602;
16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COUNTR::

ZIP: 94080
COMPUTER READABLE FORM:
MEDIUM TYPE: 5.25 inch, 360 Kb floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS

Algorian functional protein - Helicobacter pylori (strain J99)
C.Species: Helicobacter pylori
A.Variety: strain J99
G.Species: Helicobacter pylori
A.Variety: strain J99
C.Accession: H7839
C.Accession: H7839
C.Accession: H7839
B.Alm, R.A.; Ling, L.S.L.; Moir, D.T.; King, B.L.; Brown, E.D.; Doig, P.C.; Smith, D.R.; J. Fres, C.; Gibson, R.; Merberg, D.; Mills, S.D.; Jiang, Q.; Taylor, D.E.; Vovis, G.F.; J. Aritle: Genomic sequence comparison of two unrelated isolates of the human gastric path A.Reference number: A71800; MUID:99120557; PMID:9923682
A.Accession: H71839
A.Status: preliminary

-!- FUNCTION: MAY PLAY A ROLE IN THE PROCESSES OF LYMPHOCYTE HOMING TO SECONDARY LYMPHOLD ORGANS.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
-!- TISSUE SPECIFICITY: PROMINENTLY EXPRESSED ON HIGH ENDOTHELIAL VENULES BUT IS ALSO PRESENT ON THE ENDOTHELIA OF OTHER VESSELS.
LOCALIZED TO THE INTERCELLULAR BOUNDARIES OF HIGH ENDOTHELIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 YHKAYGFSAPKDOQVVTAVXYQEAILACKTPKKTVXSRLEWKKLGRSVSFVYYQQTLQGD

C. -: FUNCTION: The ruyA-ruyB complete by meticase that mediates the homelogous recombination. RuyAB is an helicase that mediates the Holliday junction migration by localized denaturation and reanneling (By similarity).

C. -: SUBUNIT: Forms a complex with ruyA (By similarity).

C. -: SIMILARITY: Belongs to the ruyB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. -!- FUNCTION: Control of topological states of DNA by transient
breakage and subsequent rejoining of DNA strands. Topoisomerase II
makes double-strand breaks.
-!- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining

-!- SUBCELLULAR LOCATION: Nuclear.
-!- MISCELLANBOUS: Eukaryotic topoisomerase I and II can relax both negative and positive supercoils, whereas prokaryotic enzymes relax only negative supercoils.
-!- SIMILARITY: Belongs to the type II topoisomerase family.

H.J., Kamerbeek J., Palacios C., Rausell C., Abascal F., Van Ham R.C. H.J., Kamerbeek J., Palacios C., Rausell C., Abascal F., Van Ham R.C. H.J., Kamerbeek J., Palacios C., Rausell C., Abascal F., Abascolla U., Fernandez J., Jimenez L., Postigo M., Silva F.J., Tamames J., Viguera E., Latorre A., Valencia A., Moran F., Moya A.; Reductive genome evolution in Buchnera aphidicola."; Proc. Natl. Acad. Sci. U.S. A. 100:581-586(2003).

1. CATALYTIC ACTIVITY: 2 ATP + L-glutamine + CO(2) + H(2)O = 2 ADP + COFACTOR: Binds 3 manganese ions per subunit (By similarity).

1. COFACTOR: Binds 3 manganese ions per subunit (By similarity).

2. I PATHWAY: Arginia biosynthesis; first step.

2. I PATHWAY: Pyrimidine biosynthesis; first step.

3. SIBUNIT: Composed of two chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used by the large (or ammonia) chain to synthesize carbamoyl phosphate (By similarity).

2. SIMILARITY: Belongs to the carB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 636 FKYSGPED-----DAISLAFSKKOVDDRKEWLTNFMEDRRORKLLGLPEDYLYG 685

-!- FUNCTION: The ruvA-ruvB complex in the presence of ATP renatures cruciform structure in supercoiled DNA with palindromic sequence, indicating that it may promote strand exchange reactions in homologous recombination. RuvAB is an halicase that mediates the Holliday junction migration by localized denaturation and reannelling (By similarity).
-!- SUBGNUT: Forms a complex with ruvA (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4 AYGFSAPKD--QQVVTAVXYQBAILACKTPKKTVXSRLEWKKLG----RSVSFVYYQQTL

                                                                                                                                                                                                                                   synaptogenesis...

Invertor 20:55-270 (1998)...

Neuton 20:55-270 (1998)...

Invertor 20:55-270 (1998)...

The multiple isoforms perform diverse functions: Cystein-rich domain containing isoforms (isoforms 2-4) probably regulate the expression of micotinic acetylcholine receptors at developing interneuronal synapses. The Ig-NRG isoform is required for the initial induction and/or maintenance of the mature levels of acetylcholine receptors at neuromuscular synapses.

-!- SUBCELIULAR LOCATION: Exists as a type I membrane protein and as a proteolytically released soluble growth factor form. The membrane-bound form does not seem to be active (By similarity).

-!- ALTERNATIVE PRODUCTS:

Comment=Additional isoforms seem to exist;

Name=1; Synonyms=ARIA, IG-NRG;

Isoform 1 is not expressed until ED 6 in spinal cord. At ED 11 both isoforms display comparable levels. DOMAIN: The cytoplasmic domain may be involved in the regulation of trafficking and proteolytic processing. Regulation of the proteolytic processing involves initial intracellular domain dimerization (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isoid=Q05199-1; Sequence=Displayed;
Note=Contains an Ig-1ke domain;
Nome=2; Synonyms=CRD-NRG-BETA1A;

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- CORACTOR: Magnesium (By similarity).
-!- SIMIMARITY: Belongs to the Ser/Thr family of protein kinases. MAP kinase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota, Metazoa, Nematoda, Chromadorea, Rhabditida, Rhabditoidea,
Rhabditidae, Peloderinae, Caenorhabditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-OCT-1996 (Rel. 34, Created)
28-FEB-2003 (Rel. 41, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Putative serine/threonine-protein kinase COSDIO.2 in chromosome III
                                                                                                                                                                                                                                     DNA repair; SOS response; ATP-binding; DNA recombination; Helicase. "Role of the ruvB gene in homologous and homeologous recombination in Rhizobium etli.";
Rhizobium etli.";
Gene 243:125-131(2000).
-!- FUNCTION: The ruvA-ruvB complex in the presence of ATP renatures cruciform structure in supercoiled DNA with palindromic sequence, indicating that it may promote strand exchange reactions in homologous recombination. RuvAB is an helicase that mediates the Holliday junction migration by localized denaturation and reanneling (By similarity).
-!- SUBUNIT: Forms a complex with ruvA (By similarity).
-!- SIMILARITY: Belongs to the ruvB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Nordanization of the botulinum neurotoxin C1 gene and its associated non-toxic protein genes in Clostridium botulinum C 468.";
Mol. Gen. Genet. 243:331-640(1994).

- 1- SUBUNIT: HA IS COMPOSED OF SUBCOMPONENTS HAVING 53, 33, 22-23, AND 17 kDa. BOTULINUM TOXINS ARE PRODUCED AS PROGENITOR TOXINS OF LARGE MOLECULAR SIZES OF 128 (M TOXIN), 168 (L TOXIN) AND 198 (LL TOXIN). M TOXIN CONSISTS OF THE M TOXIN AND THE NEUROTOXIN. L TOXIN CONSISTS OF THE M TOXIN AND HA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
